Cypress Preventive Imaging

Mission

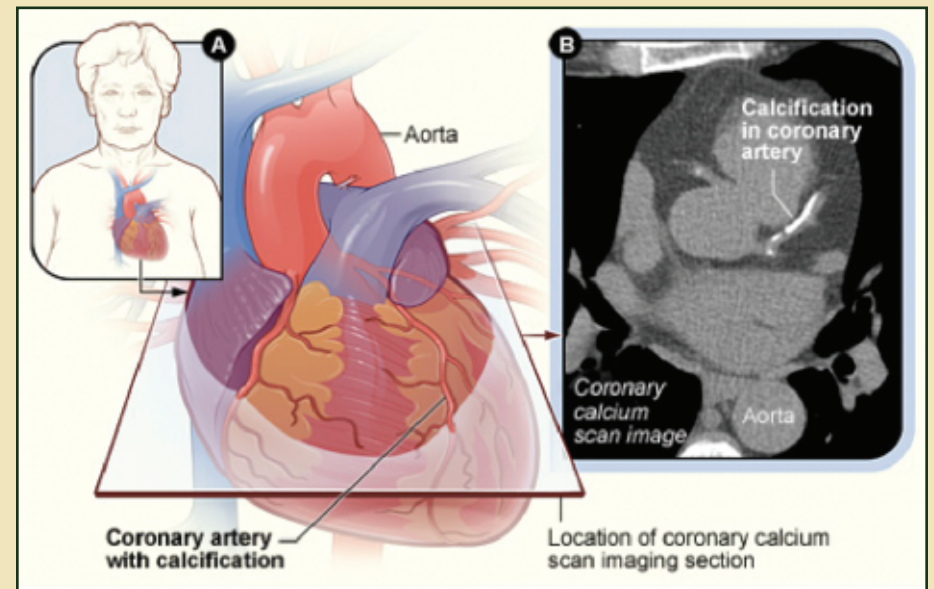

We are providing comprehensive state-of-the-art cardiovascular imaging. All studies are performed in our accredited nuclear, echocardiography, and vascular ultrasound labs and interpreted by a board certified cardiologist.

Services

- 2D Echocardiography with Doppler
- 3D Echocardiography with Doppler **NEW**
- Nuclear stress test
- Carotid artery ultrasound (with or without IMT)
- Venous and arterial ultrasound
- Electron Beam Tomography Heart Scan **NEW**
- Electron Beam Tomography Full Body Scan **NEW**
- Electron Beam Tomography angiogram of aorta, **NEW** carotid arteries and peripheral arteries

Electron Beam Tomography

Electron beam tomography (EBT) is a new diagnostic tool for the detection of atherosclerotic disease in its earliest stage. Numerous studies have shown that conventional clinical risk scores fail to identify a large percentage of patients with significant atherosclerotic burden. EBT has the highest negative predictive value (99%) for the detection of atherosclerotic disease among all non-invasive imaging techniques. Its radiation exposure is comparable to that of a mammogram, which is about five to ten times less than the radiation exposure during a nuclear stress test.

EBT is the ideal test for further risk stratification of patients with one or more risk factors for coronary artery disease. Further applications include a full body scan, and angiograms of aorta, carotid and peripheral arteries.
